

Pramo Jewels

AI Development Rules

Document ID: PJ-AIDR-001
Version: 1.0
Status: Approved

Field	Value
Project	Pramo Jewels Premium E-Commerce Platform
Purpose	Define mandatory rules for AI-assisted software development to ensure consistency and quality across all development phases.
Audience	Developers, AI Coding Assistants, Architects, QA, DevOps
Version	1.0

AI Development Rules

Rule Category	Requirements
Architecture	Follow approved layered architecture and module boundaries
Code Quality	Readable, reusable, documented and testable code
Security	RBAC, validation, encryption and secure secret handling
Database	Use migrations, parameterized queries and transactions
API	Follow REST standards, validation and versioning
Testing	Provide unit, integration and regression tests
Documentation	Update technical documentation with every change
Review	Human review required before merge or deployment

Objectives

Ensure AI-generated code aligns with project architecture, business requirements and engineering best practices.

Coding Standards

Follow project naming conventions, folder structure, formatting rules and dependency management policies.

Security Requirements

Never hard-code credentials, validate all inputs, sanitize outputs and comply with the project's security policies.

Change Management

AI-generated changes must be traceable, linked to requirements and reviewed through the standard pull-request workflow.

Quality Assurance

AI-generated code must pass linting, automated tests, code review and static analysis before acceptance.

Operational Rules

Maintain backward compatibility where required, minimize technical debt and preserve existing business functionality.

Knowledge Sources

Use project architecture, API specifications, database schema and approved documentation as the primary reference.

Acceptance Criteria

AI-generated deliverables compile successfully, pass required quality gates, conform to project standards and receive reviewer approval.
