

Pramo Jewels

AI Testing Guide

Document ID: PJ-AITG-001
Version: 1.0
Status: Approved

Field	Value
Project	Pramo Jewels Premium E-Commerce Platform
Purpose	Define standards for testing AI-assisted code, features and system integrations.
Audience	QA Engineers, Developers, AI Coding Assistants, Test Leads, DevOps
Version	1.0

AI Testing Standards

Testing Area	Guidelines
Unit Testing	Validate individual methods, services and components
Integration Testing	Verify APIs, databases and third-party services
Functional Testing	Confirm business requirements and workflows
Regression Testing	Ensure existing functionality remains unaffected
Security Testing	Validate authentication, authorization and vulnerabilities
Performance Testing	Measure response times, scalability and resource usage
UI Testing	Verify responsiveness, accessibility and user experience
Automation	Integrate automated tests into CI/CD pipelines

Objectives

Ensure AI-generated code is functionally correct, secure, performant and aligned with business requirements before deployment.

Test Design

Generate comprehensive positive, negative, boundary and edge-case test scenarios with traceability to requirements.

Automation Strategy

Prioritize automated unit, API, regression and smoke tests and execute them through the CI/CD pipeline.

Quality Gates

Require successful builds, passing automated tests, security scans and code reviews before approving AI-generated changes.

Defect Management

Record defects with severity, reproduce issues, verify fixes and maintain traceability throughout the lifecycle.

Documentation

Maintain test cases, execution reports, evidence, coverage metrics and AI-generated testing artifacts.

Integration

Integrates with CI/CD, Issue Tracking, Monitoring, Security Testing, API Testing and Performance Testing tools.

Acceptance Criteria

AI-generated features pass all required test suites, meet coverage goals, satisfy quality gates and receive stakeholder approval.
