

Pramo Jewels

Webhook Documentation

Document ID: PJ-WEBHOOK-001

Version: 1.0

Status: Draft

Field	Value
Project	Pramo Jewels Premium E-Commerce Platform
Purpose	Define webhook events, payload standards and security requirements
Audience	Backend Developers, Integration Partners, QA
Version	1.0

Supported Webhook Events

Provider	Event	Endpoint
Payment Gateway	payment.success	POST /api/v1/webhooks/payments
Payment Gateway	payment.failed	POST /api/v1/webhooks/payments
Payment Gateway	refund.completed	POST /api/v1/webhooks/payments
Courier	shipment.created	POST /api/v1/webhooks/shipping
Courier	shipment.in_transit	POST /api/v1/webhooks/shipping
Courier	shipment.delivered	POST /api/v1/webhooks/shipping
Courier	shipment.returned	POST /api/v1/webhooks/shipping

Payload Format

Accept JSON payloads containing event type, event ID, timestamp, resource identifier, status, metadata and digital signature headers.

Security

Verify HMAC signatures, require HTTPS, validate source IPs where supported, reject unsigned requests and prevent replay attacks using timestamps/nonces.

Idempotency

Use unique event IDs to ensure repeated deliveries do not trigger duplicate business actions.

Retry Policy

Respond with HTTP 2xx after successful processing. Non-2xx responses may be retried by providers using exponential backoff.

Processing Flow

Receive webhook → Verify signature → Validate payload → Store event → Execute business logic → Update database → Return 200 OK.

Logging & Monitoring

Log every webhook request, processing result, latency and failures with correlation IDs for auditing and troubleshooting.

Testing

Provide sandbox endpoints, sample payloads and automated integration tests for payment and shipping events.

Versioning

Support versioned webhook payloads and maintain backward compatibility where feasible.
