

Pramo Jewels

Animation & Motion Design Guide

Document ID: PJ-MOTION-001

Version: 1.0

Status: Draft

Field	Value
Project	Pramo Jewels Design System
Purpose	Define the motion language and animation standards
Audience	UI/UX Designers, Frontend Developers, Motion Designers, AI Coding Agents
Version	1.0

1. Motion Philosophy

Motion should communicate refinement and confidence. Animations must guide attention, provide feedback and enhance storytelling without distracting from the jewellery.

2. Core Principles

- Purpose before decoration.
- Smooth and cinematic.
- Consistent timing.
- Performance-first.
- Respect reduced-motion preferences.

3. Timing & Easing

Fast: 150–200 ms

Standard: 250–400 ms

Large transitions: 450–700 ms

Use smooth ease-in-out curves; avoid exaggerated bounce effects.

4. Page Transitions

- Soft fade and slide transitions.
- Preserve scroll position where appropriate.
- Avoid abrupt page flashes.

5. Scroll Animations

- Gentle reveal on scroll.
- Layered parallax with restraint.
- Section-by-section storytelling.
- Trigger animations only once unless interaction requires replay.

6. Micro-Interactions

Buttons: subtle elevation and glow.
Cards: slight lift on hover.
Inputs: animated focus states.
Wishlist: elegant heart transition.
Cart: smooth confirmation feedback.

7. Product Motion

- 360° product rotation.
- Smooth zoom.
- Soft lighting transitions.
- Variant changes with crossfade.
- Premium image gallery animations.

8. Loading Experience

- Minimal luxury loader.
- Skeleton screens.
- Progressive asset loading.
- Avoid blocking interactions unnecessarily.

9. Cursor & Navigation

- Refined custom cursor.
- Magnetic CTA buttons.
- Smooth menu expansion.
- Elegant dropdown transitions.

10. 3D Motion

- Realistic object rotation.
- Subtle camera movement.
- Controlled reflections.
- Maintain 60 FPS target on supported hardware.

11. Performance

- Lazy-load animation assets.
- Prefer GPU-accelerated transforms.
- Avoid layout thrashing.
- Limit simultaneous animations.

12. Accessibility

- Honor prefers-reduced-motion.
- Avoid flashing content.
- Ensure animations never hide critical information.
- Maintain keyboard accessibility.

13. Recommended Technologies

GSAP for complex timelines, Framer Motion for React components, Lenis for smooth scrolling, Three.js / React Three Fiber for premium 3D experiences.

14. Do's & Don'ts

Do:

- Keep motion subtle and purposeful.
- Maintain consistent easing.
- Test across devices.

Don't:

- Overuse animations.
- Use distracting effects.
- Sacrifice performance for visual flair.
