

Pramo Jewels

Tracking Workflow

Document ID: PJ-TRK-001

Version: 1.0

Status: Approved for Development

Field	Value
Project	Pramo Jewels Premium E-Commerce Platform
Purpose	Define the end-to-end shipment tracking workflow and real-time status synchron
Audience	Backend Developers, Logistics Team, Customer Support, QA
Version	1.0

Shipment Tracking Lifecycle

Tracking Stage	Description
Shipment Created	Tracking ID and AWB generated.
Picked Up	Courier collects package.
In Transit	Shipment moves through logistics network.
Hub Processing	Package processed at transit hubs.
Out for Delivery	Courier starts final delivery attempt.
Delivered	Shipment delivered successfully.
Delivery Exception	Delay, address issue or failed attempt.
Return to Origin	Shipment returned if delivery fails.

Tracking Workflow

Shipment Creation → Courier Pickup → Real-Time Tracking Updates → Out for Delivery → Delivered or Delivery Exception → Order Status Synchronization.

Status Synchronization

Receive courier webhooks, validate signatures, update shipment status, refresh customer tracking page and record audit events.

Customer Experience

Provide tracking timeline, estimated delivery date (EDD), current location (where available), courier details and tracking link.

Notification Triggers

Send notifications when shipment is dispatched, reaches key milestones, goes out for delivery, is delivered or encounters exceptions.

Business Rules

Only authenticated users may view their shipment history. Manual tracking updates require authorized administrative access.

Performance

Cache frequently accessed tracking data, process webhook events asynchronously and retry temporary synchronization failures.

Monitoring

Measure tracking update latency, webhook success rate, SLA compliance, exception frequency and tracking page availability.

Acceptance Criteria

Tracking remains accurate across systems, customer-visible status matches courier data and every tracking event is audit logged.
